Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

SPECIFICATION

BACKGROUND OF THE INVENTION

[0001] FIELD OF THE INVENTION: This invention relates to catalyst system for the polymerization of olefins, particularly, to a catalyst system comprising a supported Ziegler-Natta catalyst which has been modified with metallocene, preferably during synthesis. The catalyst system is used to polymerize α -olefins, such as propylene.

[0002] DESCRIPTION OF THE PRIOR ART: Polyolefin manufacturing processes typically involve the polymerization of olefin monomer with an organometallic catalyst of the Ziegler-Natta type. Catalyst systems for the polymerization of olefins are well known in the art. Typically, these systems include a Ziegler-Natta type polymerization catalyst component; a co-catalyst, usually an organoaluminum compound; and an external electron donor compound or selectivity control agent, usually an organosilicon compound. Examples of such catalyst systems are shown in the following U. S. Patents: 4,107,413; 4,294,721; 4,439,540; 4,115,319; 4,220,554; 4,460,701; and 4,562,173.

[0003] A Ziegler-Natta type polymerization catalyst is basically a complex derived from a halide of a transition metal, for example, titanium, chromium or vanadium with a metal hydride and/or a metal alkyl, typically an organoaluminum compound, as a co-catalyst. The catalyst is usually comprised of a titanium halide supported on a magnesium compound complexed with an alkylaluminum co-catalyst.

[0004] It is known that two or more homogeneous catalysts, such as those based on metallocene compounds, may be combined to effect properties, such as molecular weight distribution. U.S. Patent No. 4,530,914 discloses use of a catalyst system comprising two or more metallocenes in the polymerization of α -olefins, primarily ethylene, to obtain a broad molecular weight distribution. The metallocenes each have different propagation and termination rate constants. The metallocenes are mixed with an alumoxane to form the catalyst system.

[0005] It is also known that metallocenes may be affixed to a support to simulate a heterogeneous catalyst. U.S. Patent No. 4,808,561 discloses reacting a metallocene with an alumoxane and forming a reaction product in the presence of a support. The support is a porous material like talc, inorganic oxides such as Group IIA, IIIA IVA or IVB metal oxides like silica, alumina, silica-alumina, magnesia, titania, zirconia and mixtures thereof, and resinous material such as polyolefins, e.g., finely divided polyethylene. The metallocenes and alumoxanes are deposited on the dehydrated support material.

[0006] In U.S. Patent No. 4,701,432 a support is treated with at least one metallocene and at least one non-metallocene transition metal compound. To form a catalyst system a cocatalyst comprising an alumoxane and an organo-metallic compound of Group IA, IIA, IIB and IIIA is added to the supported metallocene/non-metallocene. The support is a porous solid such as talc or inorganic oxides or resinous materials, preferably an inorganic oxide, such as silica, alumina, silica-alumina, magnesia, titania or zirconia, in finely divided form. By depositing the soluble metallocene on the support material it is converted to a heterogeneous supported catalyst. The transition metal compound, such as $TiCl_4$, is contacted with the support material prior to, after, simultaneously with or separately from contacting the metallocene with the support.

[0007] EP-A- 412, 750 discloses a titanium-containing solid catalyst component and a catalyst system containing that catalyst component, said catalyst system being used for the polymerization of α -olefins.

[0008] EP-A- 436, 328 discloses a method for producing highly sterically regulated polyolefins, having a broad molecular weight distribution, using a catalyst containing a specific transition metal compound.

[0009] It is known that Cp_2TiCl_2 in the presence of alkylaluminum compounds polymerizes ethylene but not propylene whereas in the presence of methylalumoxane (MAO) Cp_2TiCl_2 polymerizes propylene also to produce atactic polypropylene. Combination of dimethyl titanocene and its Cp-substituted analogues and $TiCl_3$ for propylene polymerizations has been reported in U.S. Patent No. 2,992,212 and in "Thermoplastic Elastomers Based on Block Copolymers of Ethylene and Propylene", G. A. Lock, Advances in Polyolefins, p. 59-74, Raymond B. Seymour, Ed. MAO was not used in this polymerization.

[0010] It would be advantageous to change polymer properties in a polymerization processes by using a supported Ziegler-Natta catalyst which has been modified by metallocene compound.

SUMMARY OF THE INVENTION

[0011] Accordingly, an object of this invention is to change polymer properties in polymerization processes using a supported Ziegler-Natta catalyst which has been modified with a metallocene compound.

[0012] Also, an object of this invention is to produce a polyolefin having high molecular weight and broad molecular weight distribution.

[0013] These and other objects are accomplished by a catalyst system comprising a supported Ziegler-Natta catalyst

modified with a metallocene compound as an additive used in a polymerization process for polymerizing olefins, especially propylene.

DETAILED DESCRIPTION OF THE INVENTION

[0014] The present invention provides for a catalyst for polymerization of olefins comprising:

- a) a supported Ziegler-Natta transition metal catalyst component modified with a metallocene compound as an additive in the synthesis of the catalyst component;
- c) an aluminum trialkyl co-catalyst; and
- d) an external electron donor.

[0015] The present invention also provides a process for the polymerization of olefins using the catalyst system described above comprising:

- a) selecting a conventional Ziegler-Natta transition metal catalyst component modified with a metallocene compound;
- b) contacting the catalyst component with an organoaluminum co-catalyst compound;
- c) contacting the catalyst component with an electron donor either after or simultaneously with step b) to form a catalyst system;
- d) introducing the catalyst system into a polymerization reaction zone containing a monomer under polymerization reaction conditions to form a polymer product; and
- e) extracting polymer product from the polymerization reaction zone.

The polymer product extracted from the reactor has a broad molecular weight distribution.

[0016] A Ziegler-Natta catalyst may be pre-polymerized to improve the performance of the catalyst. Generally, a prepolymerization process is effected by contacting a small amount of monomer with the catalyst after the catalyst has been contacted with the electron donor. A pre-polymerization process is described in U.S. Patent Nos. 4,767,735, 4,927,797 and 5,122,583.

[0017] Any of the conventional supported Ziegler-Natta transition metal compound catalyst components can be used in the present invention. The transition metal compound is preferably of the general formula MR^1_x where M is the metal, R^1 is a halogen or a hydrocarbyloxy and x is the valence of the metal. Preferably, M is a Group IVB metal, more preferably a Group IVB, and most preferably titanium. Preferably, R^1 is chlorine, bromine, an alkoxy or a phenoxy, more preferably chlorine or ethoxy and most preferably, chlorine. Illustrative examples of the transition metal compounds are $TiCl_4$, $TiBr_4$, $Ti(OC_2H_5)_3Cl$, $Ti(OC_2H_5)_2Cl_2$, $Ti(OC_3H_7)_2Cl_2$, $TiO(C_6H_{13})_2Cl_2$, $Ti(OC_2H_5)_2Br_2$ and $Ti(OC_{12}H_{25})Cl_3$. Mixtures of the transition metal compounds may be used. No restriction on the number of transition metal compounds is made as long as at least one transition metal compound is present.

[0018] The support should be an inert solid which is chemically unreactive with any of the components of the conventional Ziegler-Natta Catalyst. The support is preferably a magnesium compound. Examples of the magnesium compounds which are to be used to provide a support source for the catalyst component are magnesium halides, dialkoxymagnesiums, alkoxy magnesium halides, magnesium oxyhalides, dialkylmagnesiums, magnesium oxide, magnesium hydroxide, and carboxylates of magnesium.

[0019] The organoaluminum co-catalyst is preferably an aluminum alkyl of the formula AlR^2_3 where R^2 is an alkyl having 1-8 carbon atoms, R^2 being the same or different. Examples of aluminum alkyls are trimethyl aluminum (TMA), triethyl aluminum (TEAL) and triisobutyl aluminum (TIBAL). The preferred aluminum alkyl is TEAL.

[0020] The term "electron donor" as used herein, refers to the external electron donor or selectivity control agent (SCA). The external electron donor acts as a stereoregulator to control the amount of atactic form of polymer produced. It may also increase the production of isotactic polymers. The electron donor for the present invention is any one of the stereoselectivity control agents which are effective with Ziegler-Natta catalysts. Typically, an electron donor is an organosilicon compound. The electron donors included in the present invention are organic silicon compounds such as those described by the following formula:

where R is an alkyl group, a cycloalkyl group, an aryl group or a vinyl group, $R^{\#}$ is an alkyl group, m is 0-4, R may be the same or different, $R^{\#}$ may be the same or different. Examples of electron donors are cyclohexylmethyldimethoxysilane (CMDMS), diphenyldimethoxysilane (DPMS) and isobutyl trimethoxysilane (IBMS). Other examples of electron

donors are disclosed in U.S. Patent Nos. 4,218,339; 4,395,360; 4,328,122; 4,473,660; 4,562,173 and 4,547,552.

[0021] The preferred electron donor is CMDs.

[0022] The metallocene compound may be a cyclopentadienide, i.e., a metal derivative of a cyclopentadiene. The metallocene should contain at least one cyclopentadiene ring and be of the general formula:

where Cp is a cyclopentadienyl ring, R and R' are substituents on the cyclopentadienyl rings and can be a hydride or a hydrocarbyl from 1-9 carbon atoms, each R and R' being the same or different, each (CpR_{5-n}) and (CpR'_{5-n}) being the same or different, a and b are 0 or 1, indicating whether the particular Cp ring is present, but at least one of a or b must be 1; R^a is a structural bridge between $(CpR_{5-n})_a$ and $(CpR'_{5-n})_b$ to impart stereorigidity, n being 1 or 0 to indicate whether the bridge is present or not and when n=1, a and b both must equal 1; M' is Group IVB metal; R* is a hydride, a halogen or a hydrocarbyl from 1-20 carbon atoms, v is the valence of M'. Preferably, a is 1 and b is 1, (CpR_{5-n}) and (CpR'_{5-n}) are the same and are cyclopentadienyl rings such that they are unsubstituted cyclopentadienyl and n is 0, i.e., unbridged. Preferably, M' is titanium, which have valences of 4. Preferably, R* is a halogen or alkyl, most preferably chlorine or methyl.

[0023] The standard synthesis procedure is:

- a) selecting a solid component comprising magnesium dialkoxide of the general formula $Mg(OR^2)_2$ where R² is a hydrocarbyl or substituted hydrocarbyl of 1 to 20 carbon atoms;
- b) adding a chlorinating agent; and
- c) adding a titanating agent.

[0024] The synthesis procedure for Ziegler-Natta type catalysts for the polymerization of olefins is disclosed in U.S. Patent Nos. 3,574,138; 3,642,746; 4,069,169; 4,226,741; 4,636,486; 4,816,433; 4,839,321 and 4,927,797.

[0025] The present invention modifies the synthesis procedure, and thus modifies the catalyst, by adding a metallocene compound during the synthesis process. The specific synthesis procedure used was:

- a) selecting a solid component comprising magnesium diethoxide;
- b) adding titanium tetrachloride;
- c) heating to promote reaction;
- d) washing with heptane;
- e) adding titanium tetrachloride;
- f) heating to promote reaction;
- g) drying in a vacuum.

The metallocene compound was added :

- 1) prior to the first addition of titanium tetrachloride,
- 2) during heating following the first addition of titanium tetrachloride,
- 3) prior to the second addition of the titanium tetrachloride or
- 4) during heating following the second addition of titanium tetrachloride.

The amount of metallocene added is such that a molar ratio of titanium tetrachloride added in either steps b) or e) to metallocene (Ti/Cp) is at least 5, preferably 5 to 200, more preferably 20 to 100 and most preferably is about 100.

[0026] The invention having been generally described, the following examples are given as particular embodiments of the invention and to demonstrate the practice and advantages thereof. It is understood that the examples are given by way of illustration and are not intended to limit the specification or the claims to follow in any manner.

PREPARATION OF THE CATALYST

COMPARATIVE EXAMPLE

[0027] A round-bottom flask having a capacity of 500 ml and provided with a stirrer, the inner atmosphere of which was sufficiently substituted with nitrogen gas, was charged at room temperature with 10 g of diethoxy magnesium and 80 ml of toluene to form a slurry. The slurry was heated to 90°C on an oil bath. Next, 20 ml of $TiCl_4$ were added dropwise to the slurry while stirring. Then, 2.7 ml of n-butyl phthalate were added and the temperature was further elevated to

115°C and maintained for two hours with stirring. After cooling to 90°C, stirring ceased and precipitate was allowed to settle. The solid was separated and washed twice with 200 ml of toluene. While maintaining the temperature at 90°C, the solid was slurried in 80 ml of toluene. 20 ml of TiCl_4 were added dropwise to the composition and the resulting mixture was heated with stirring to a temperature of 115°C which was maintained for 2 hours. After the reaction, the composition was cooled to 90 °C, stirring ceased and the solid allowed to settle. The solid was separated, the temperature decreased to 40°C and was washed five times with 150 ml of n-heptane. The resulting catalyst component was dried in vacuum with heat to 35-40°C to yield a dry powder.

EXAMPLE 1

[0028] The catalyst was synthesized using the procedure of the Comparative Example except after the addition of diethoxy magnesium and toluene and before adding TiCl_4 , 9.2 mmoles of Cp_2TiCl_2 was added as a slurry in toluene at room temperature.

EXAMPLE 2

[0029] The catalyst was synthesized using the procedure of Example 1 except that 1.8 moles of Cp_2TiCl_2 was used.

EXAMPLE 3

[0030] The catalyst was synthesized using the procedure of the Comparative Example except after the addition of diethoxy magnesium, toluene, TiCl_4 and n-butyl phthalate, 18.5 mmoles of Cp_2TiCl_2 was added after one hour of heating at 115°C.

EXAMPLE 4

[0031] The catalyst was synthesized using the procedure of Example 3 except that 9.2 mmoles of Cp_2TiCl_2 was used.

EXAMPLE 5

[0032] The catalyst was synthesized using the procedure of Example 3 except that 1.8 mmoles of Cp_2TiCl_2 was used.

EXAMPLE 6

[0033] The catalyst was synthesized using the procedure of the Comparative Example except prior to the second addition of TiCl_4 , 4.6 mmoles of Cp_2TiCl_2 was added at 90°C with stirring for fifteen minutes.

EXAMPLE 7

[0034] The catalyst was synthesized using the procedure of Example 6 except that 1.8 mmoles of Cp_2TiCl_2 was used.

EXAMPLE 8

[0035] The catalyst was synthesized using the procedure of Example 6 except that 0.9 mmoles of Cp_2TiCl_2 was used.

EXAMPLE 9

[0036] The catalyst was synthesized using the procedure of Example 6 except that 0.45 mmoles of Cp_2TiCl_2 was used.

EXAMPLE 10

[0037] The catalyst was synthesized using the procedure of the Comparative Example except after the second addition of TiCl_4 and heating at 115°C with stirring for 1 hour, 1.8 mmoles of Cp_2TiCl_2 was added and the heating and stirring continued for another hour.

SUMMARY OF POLYMERIZATION CONDITIONS

[0038]

wt. of catalyst:	10.0 mgrams
amount of TEAl (co-catalyst):	1.0 mmoles
Al/Ti ratio	200*
amount of CMDS (donor):	0.02 and 0.10 mmoles
Al/Si ratio	50 and 10, respectively
Hydrogen	16 mmoles
Propylene:	720g (1.4L)
Temp.:	70°C
Time:	<60 mins.

* excluding titanium from metallocene

[0039] Prior to a polymerization run, all traces of moisture and air were expelled from a 2 L reactor by heating to a temperature over 100°C for a minimum of 30 minutes under a constant purge of dry nitrogen. Following this heating, the reactor was cooled to room temperature (25°C) under nitrogen. The reactor was stabilized at room temperature and then the hydrogen and 1.0 L of propylene were added. The reactor was then stirred at 1000 rpm. The TEAl co-catalyst and the CMDS electron donor were added to a 40 cc tubular reaction vessel. A catalyst as prepared in the Examples above was slurried in mineral oil suspension and added to the 40 cc reaction vessel. The co-catalyst/electron donor mixture was allowed to precontact approximately five minutes, and the final mixture with catalyst was allowed to contact for approximately two minutes prior to use. The 40 cc reaction vessel was then attached to an entry point on the 2 L reactor and the catalyst mixture was flushed into the 2 L reactor with room temperature liquid propylene. The reactor temperature was then raised to 70°C. The total amount of propylene present in the reactor was about 1.4 L. The polymerization reaction was allowed to proceed for one hour, at which point it was terminated by venting the excess propylene and cooling the reactor to room temperature. The reactor was then opened to collect the polymer product which was dried and analyzed. The molecular weight distribution or polydispersity (D) given as the ratio of weight-average to number-average molecular weight (M_w/M_n) was determined by gel permeation chromatography (GPC). The polymerization results are tabulated in Table 1.

TABLE 1

Example	Ti/Cp	D (M_w/M_n)
Comparative	0	6.48
1	10	11.0*
2	50	8.54
3	5	9.62
4	10	14.4*
5	50	10.71
6	20	14.96
7	50	13.9*
8	100	18.8*
9	200	14.78
10	50	10.38

*Average results of more than one run at the same conditions

[0040] The data above indicates that addition of a metallocene in the synthesis of a catalyst broadens the polydispersity of polypropylene. Preferably, the metallocene is added prior to the second addition of titanium tetrachloride.

Claims

1. A process for making a catalyst component comprising the steps 1) to 4) in the following sequence :

1) selecting a solid component comprising magnesium dialkoxide of the general formula $Mg(OR^2)_2$ where R^2 is a hydrocarbyl or substituted hydrocarbyl of 1 to 20 carbon atoms ;
 2) adding a chlorinating agent;
 3) adding a metallocene of the general formula:

where Cp is a cyclopentadienyl ring, R and R' are substituents on the cyclopentadienyl rings and can be a hydride or a hydrocarbyl from 1-9 carbon atoms, each R and R' being the same or different, each (CpR_{5-n}) and (CpR'_{5-n}) being the same or different, a and b are 0 or 1, indicating whether the particular Cp ring is present, but at least one of a or b must be 1 ; R'' is a structural bridge between $(CpR_{5-n})_a$ and $(CpR'_{5-n})_b$ to impart stereorigidity, n being 1 or 0 to indicate whether the bridge is present or not; M' is Group IVB metal, R* is a hydride, a halogen or a hydrocarbyl from 1-20 carbon atoms, v is the valence of M'; and
 4) adding a titanating agent.

2. A process for making a catalyst as recited in claim 1 wherein (CpR_{5-n}) and (CpR'_{5-n}) are the same and are unsubstituted cyclopentadienyl.
3. A process for making a catalyst as recited in claim 1 wherein the metallocene compound is bis(cyclopentadienyl) titanium dichloride.
4. The process of claim 1 wherein the titanating agent is titanium tetrachloride.
5. A process for the polymerization of olefins comprising:
- providing the catalyst component using the process of claim 1;
 - contacting the catalyst component with an organoaluminum co-catalyst compound to form an active catalyst wherein the co-catalyst is described by the formula AlR'^3 where R' is an alkyl of from 1-8 carbon atoms and R' may be the same or different;
 - introducing the catalyst into a polymerization reaction zone containing an olefin monomer under polymerization reaction conditions to form a polymer product;
 - extracting the polymer product from the reactor.
6. A process for the polymerization of propylene comprising:
- providing the catalyst component using the process of claim 1;
 - contacting the catalyst component with an organoaluminum co-catalyst compound to form an active catalyst wherein the co-catalyst is described by the formula AlR'^3 where R' is an alkyl of from 1-8 carbon atoms and R' may be the same or different;
 - introducing the catalyst into a polymerization reaction zone containing propylene under polymerization reaction conditions to form polypropylene;
 - extracting polypropylene from the reactor.
7. A process for the polymerization of propylene as recited in claim 6 wherein the co-catalyst is an aluminum alkyl of the formula $AlR^{\wedge}3$ where R^{\wedge} is an alkyl having 1-8 carbon atoms, R' being the same or different.
8. A process for the polymerization of propylene as recited in claim 7 wherein the co-catalyst is trimethyl aluminum, triethyl aluminum or triisobutyl aluminum.
9. A process for the polymerization of propylene as recited in claim 8 wherein the co-catalyst is triethyl aluminum.

Patentansprüche

1. Verfahren zum Herstellen einer Katalysatorkomponente, umfassend die Stufen 1) bis 4) in der folgenden Reihenfolge:

- 1) Auswählen einer Feststoffkomponente, umfassend Magnesiumdialkoxid der allgemeinen Formel $Mg(OR^2)_2$, wobei R^2 ein Hydrocarbyl oder substituirtes Hydrocarbyl mit 1 bis 20 Kohlenstoffatomen ist,
- 2) Hinzufügen eines Chlorierungsmittels,
- 3) Hinzufügen eines Metallocens der allgemeinen Formel:

wobei Cp ein Cyclopentadienylring ist, R und R' sind Substituenten auf den Cyclopentadienylringen und können ein Hydrid oder ein Hydrocarbyl mit 1-9 Kohlenstoffatomen sein, jedes R und R' ist gleich oder unterschiedlich, jedes (CpR_{5-n}) und (CpR'_{5-n}) ist gleich oder unterschiedlich, a und b sind 0 oder 1, angehend, ob der bestimmte Cp Ring vorhanden ist, aber mindestens eines von a oder b muß 1 sein; R'' ist eine Strukturbrücke zwischen $(CpR_{5-n})_a$ und $(CpR'_{5-n})_b$ zum Verleihen von Stereorigidität, n ist 1 oder 0, anzuzeigen, ob die Brücke vorhanden ist oder nicht; M' ist Gruppe IVB Metall, R^* ist ein Hydrid, ein Halogen oder ein Hydrocarbyl mit 1-20 Kohlenstoffatomen, v ist die Wertigkeit von M', und

- 4) Hinzufügen eines Titanierungsmittels.

2. Verfahren zum Herstellen eines Katalysators nach Anspruch 1, wobei (CpR_{5-n}) und (CpR'_{5-n}) gleich sind und unsubstituiertes Cyclopentadienyl sind.

3. Verfahren zum Herstellen eines Katalysators nach Anspruch 1, wobei die Metallocenverbindung Bis(cyclopentadienyl)titandichlorid ist.

4. Verfahren nach Anspruch 1, wobei das Titanierungsmittel Titanetetrachlorid ist.

5. Verfahren für die Polymerisation von Olefinen, umfassend:

- a) zur Verfügung stellen der Katalysatorkomponente unter Verwenden des Verfahrens nach Anspruch 1,
- b) in Kontakt bringen der Katalysatorkomponente mit einer Organoaluminium-Cokatalysatorverbindung unter Bilden eines aktiven Katalysators, wobei der Cokatalysator beschrieben ist durch die Formel AlR'_3 , wobei R' ein Alkyl mit 1-8 Kohlenstoffatomen ist, und R' kann gleich oder unterschiedlich sein,
- c) Einführen des Katalysators in eine Polymerisationsreaktionszone, enthaltend ein Olefinmonomer unter Polymerisationsreaktionsbedingungen unter Bilden eines Polymerprodukts,
- d) Extrahieren des Polymerprodukts aus dem Reaktor.

6. Verfahren für die Polymerisation von Propylen, umfassend:

- a) zur Verfügung stellen der Katalysatorkomponente unter Verwenden des Verfahrens nach Anspruch 1,
- b) in Kontakt bringen der Katalysatorkomponente mit einer Organoaluminium-Cokatalysatorverbindung unter Bilden eines aktiven Katalysators, wobei der Cokatalysator durch die Formel AlR'_3 beschrieben ist, wobei R' ein Alkyl mit 1-8 Kohlenstoffatomen ist, und R' kann gleich oder unterschiedlich sein,
- c) Einführen des Katalysators in eine Polymerisationsreaktionszone, enthaltend Propylen unter Polymerisationsreaktionsbedingungen, unter Bilden von Polypropylen,
- d) Extrahieren von Polypropylen aus dem Reaktor.

7. Verfahren für die Polymerisation von Propylen nach Anspruch 6, wobei der Cokatalysator ein Aluminiumalkyl der Formel AlR^A_3 ist, wobei R^A ein Alkyl mit 1-8 Kohlenstoffatomen ist, R' ist gleich oder unterschiedlich.

8. Verfahren für die Polymerisation von Propylen nach Anspruch 7, wobei der Cokatalysator Trimethylaluminium, Triethylaluminium oder Triisobutylaluminium ist.

9. Verfahren für die Polymerisation von Propylen nach Anspruch 8, wobei der Cokatalysator Triethylaluminium ist.

Revendications

1. Un procédé pour réaliser un composant de catalyseur comprenant les étapes 1) à 4) dans l'ordre suivant:

- 1) choisir un composant solide comprenant un dialkoxyde de magnésium de la formule générale $Mg(OR^2)_2$ où R^2 est un hydrocarbyle ou hydrocarbyle substitué de 1 à 20 atomes de carbone;
- 2) ajouter un agent de chloruration;
- 3) ajouter un métallocène de la formule générale:

où Cp est un anneau cyclopentadiényle, R et R' sont des substituants sur les anneaux cyclopentadiényles et peuvent être un hydrure ou un hydrocarbyle de 1-9 atomes de carbone, chaque R et R' étant le même ou différent, chaque (CpR_{5-n}) et (CpR'_{5-n}) étant le même ou différent, a et b sont 0 ou 1, indiquant si un anneau Cp particulier est présent, mais au moins l'un des a ou b doit être 1; R'' est un pont structurel entre $(CpR_{5-n})_a$ et $(CpR'_{5-n})_b$ pour communiquer une stéréorigidité, n étant 1 ou 0 pour indiquer si le pont est présent ou pas; M' est un métal du groupe IVB, R* est un hydrure, un halogène ou un hydrocarbyle de 1-20 atomes de carbone, v est la valence de M'; et

- 4) ajouter un agent de titanation.

2. Un procédé pour fabriquer un catalyseur selon la revendication 1 où (CpR_{5-n}) et (CpR'_{5-n}) sont identiques et sont un cyclopentadiényle non substitué.

3. Un procédé pour réaliser un catalyseur selon la revendication 1 où le composé de métallocène est un dichlorure de bis(cyclopentadiényl)titane.

4. Procédé selon la revendication 1 dans lequel l'agent de titanation est le tétrachlorure de titane.

5. Un procédé de polymérisation d'oléfines comprenant:

- a) réaliser le composant de catalyseur en utilisant le procédé de la revendication 1;
- b) mettre en contact le composant de catalyseur avec un composé de co-catalyseur d'organoaluminium pour former un catalyseur actif dans lequel le co-catalyseur est décrit par la formule AlR'_3 où R' est un alkyle de 1-8 atomes de carbone et R' peut être le même ou différent;
- c) introduire le catalyseur dans une zone de réaction de polymérisation contenant un monomère d'oléfine sous des conditions de réaction de polymérisation pour former un produit de polymère;
- d) extraire le produit polymère du réacteur.

6. Un procédé de polymérisation du propylène comprenant:

- a) réaliser le composant de catalyseur en utilisant le procédé de la revendication 1;
- b) mettre en contact le composant de catalyseur avec un composé de co-catalyseur d'organoaluminium pour former un catalyseur actif dans lequel le co-catalyseur est décrit par la formule AlR'_3 où R' est un alkyle de 1-8 atomes de carbone et R' peut être le même ou différent;
- c) introduire le catalyseur dans une zone de réaction de polymérisation contenant du propylène sous des conditions de réaction de polymérisation pour former le polypropylène;
- d) extraire le polypropylène du réacteur.

7. Procédé de polymérisation du propylène selon la revendication 6 dans lequel le co-catalyseur est un alkylaluminium de la formule AlR'_3 où R' est un alkyle de 1-8 atomes de carbone et R' étant le même ou différent.

8. Procédé de polymérisation du propylène selon la revendication 7 dans lequel le co-catalyseur est le triméthylaluminium, le triéthylaluminium, ou le triisobutylaluminium.

9. Procédé de polymérisation du propylène selon la revendication 8 dans lequel le co-catalyseur est triéthylaluminium.
